What is Phishing?

Phishing is a cyber attack that uses disguised emails as a weapon. The goal is to trick the email recipient into sharing there private details.

There are many types of **phishing**, all of them are damaging.

Phishing Attacks

 - *Spear Phishing*

 - *Malware spiked emails*

 - *Whale Phishing*

 - *Phishing for private information*

The best way to spot phishing emails is to study examples captured in the wild!
Open up your junkmail and you'll probably see quite a few in there...

How to prevent the attacks

There are a number of steps you can take and mindsets you should get into that will keep you from becoming a phishing statistic, including:

- Always check the spelling of the URLs in email links before you click or enter sensitive information

- Watch out for URL redirects, where you're subtly sent to a different website with identical design

- Pay attention to hidden attachments, some of them may be riddled with viruses

If you receive an email from a source you know but it seems suspicious, contact that source with a new email, rather than just hitting reply.

ARE YOU CYBER SAFE?

How's your Network Security? Provide your business with peace of mind.
